## DIABETIC CARE CREW SOCK

### CREW SOCK

STYLE #1680

Unisex

**Description:** Diabetic care crew sock for men and women. High-tech fibers wick away moisture and inhibit bacterial growth for a healthier environment. Seamless interior- no ridges or pressure against the skin. Dense comfort pads provide a buffer zone of protection and comfort. Non-constricting or binding to NOT impede circulation.

**Fiber Content:** Acrylic 88%, Nylon 12%

#### Features:

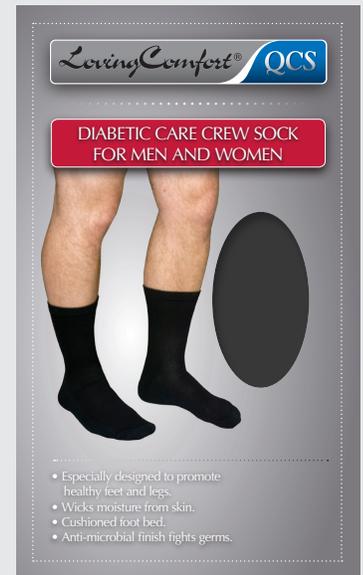

- Wicking yarn transfers moisture from skin to the outside
- Seamless toe greatly reduces pressure and protects against friction
- Cushioned "pillow soft" feel on foot bed
- Anti-microbial finish discourages bacterial growth

**Sizes:** Small, Medium, Large, X-Large

**Colors:** White and Black

Size Chart

Size	Women's Shoe Size	Men's Shoe Size
SMALL	5 - 7	4 - 6
MEDIUM	7 - 10	6 - 9
LARGE	10 - 13	9 - 12
X-LARGE	13+	12 - 15

## DIABETIC CARE OVER THE CALF SOCK

### OVER THE CALF SOCK

## KEY TO PROPER FIT

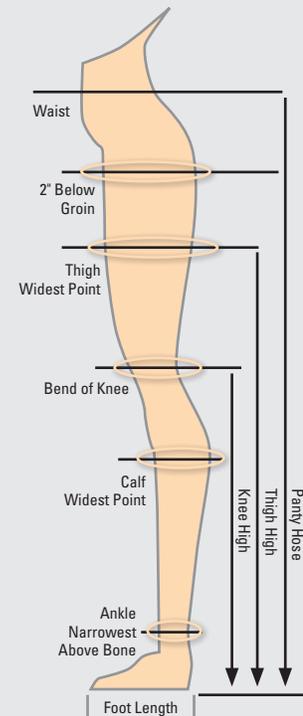

Based on standard sizes and measurements, quick and easy to use charts are included on the back of each package.

These charts are based on height/weight ratios where leg measurements are predictable and fit into specific ranges, which fit a majority of the population.

### Measuring Correctly

1. Measure when you first get up in the morning before swelling has occurred.
2. Measure while standing. If you have been standing for some time, elevate your feet and legs for 15 minutes prior to taking measurements.
3. Take snug measurements against the skin. Don't measure over socks or clothing.
4. Never allow folds in the hosiery. If used over wound dressing, make sure the hosiery isn't too tight. Consult a health care professional with any concerns.
5. The sock area must fit the shape of the foot. An improper fit will cause bunching or gathering, creating local pressure. Observe the bare foot prior to putting on the sock. The sock should conform to the shape of the bare foot.
6. Hosiery should have even compression without binding, which may create discomfort or circulation obstruction.

If the fit is questionable, use the guide at the right to take exact circumference and length measurements at the specific leg points to ensure the correct compression.

---

### Fitting Procedure for Stocking

1. Take snug measurements on the skin, not over socks or slacks. Record the measurements. Select the correct size from stock.
2. Explain features of the stocking and fitting procedure to patient.
3. Place hand inside stocking and grasp the heel piece. Pull stocking inside out, except for the heel.
4. Pull stocking over the patient's foot, until the heel piece is positioned symmetrically over the foot.
5. Continue to pull the rest of the stocking over the patient's leg.
6. Points related to fitting:
  - Wearing ribbed rubber gloves makes fitting easier. (helps prevent DeQuervain's).
  - Pat corn starch over the leg if perspiration is present. (Do not use baby powder.)
  - With edema present, patient's measurements should be taken before rising from bed.
  - With venous ulcers, stockings should not fit too tight over dressing; dressing should never be removed.

## Which Compression Level is Right For You?

### Classes of compression (mmHg = millimeters (mm) of mercury (Hg) compression):

Mild compression (8-15 mmHg) – for mild varicosity, often purchased over-the-counter.

For mild swelling from long periods of sitting or as a preventive when traveling.

Moderate compression (15-20 mmHg) – for mild varicosity and edema (physician recommended).

Firm compression (20-30 mmHg) – used in relation to a condition of superficial veins and post sclerotherapy care (physician recommended).

Extra firm compression (30-40 mmHg) – prescription hose, used for conditions within the superficial and deep vein systems.

*If any discomfort occurs, discontinue use and consult your healthcare professional.*

---

## STOCKINGS FOR PATIENTS OF ALL KINDS

Support stockings, socks and graduated compression hosiery help with leg problems and ailments. Men and women of all ages, including pregnant women can be asked to wear support stockings.

---

### Prevention is key

Low-compression (8-15 mmHg) hosiery is also beneficial to younger patients who stand on their feet for long periods during the day. Patients feel less pain and see less swelling of the legs after wearing support hose. Support hosiery provide relief from age-related issues such as spider veins, small various veins, minor swelling or legs and feet that are sore and achy.

### Travel

Long distance travel, whether by automobile, train, or airline can be associated with leg discomforts and risks. Lack of leg movement gives way to swelling of the feet and legs. Results in diminished flow of venous blood from the legs back to the heart.

### What they do

Support stockings generally work by creating pressure around your ankle. This helps with circulation. They can also assist with the treatment of minor to serious leg pain, swelling, deep vein thrombosis, varicose veins, and other leg problems.

### Why is compression important?

If you have any circulatory problems, it is very important to wear compression stockings to help keep your blood circulating. If blood and fluid are allowed to pool in your legs, lower legs, or ankles, your legs will become swollen, achy and even painful. Worse, after extended swelling your skin will begin to break down on your legs and form open wounds or leg ulcers.

Don't spend an arm and a leg to save your legs.  
Ask your local pharmacy for styles and sizes available.
